## ELEMENTS OF THE THEORY OF MECHANICS

Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1822 Excerpt: . shew the angle at which the descending branch of the curve cuts the axis. 249. Coroll. 2. Beyond that point, the ordinate  $y$  becomes negative and increases indefinitely: not so the abscissa;  $r$ , which has a limit, that it does not pass; whence we may conclude that the descending branch of the curve has a vertical asymptote. For, when  $p$  is negative, we have  $P = p \log(1 + ps) + \log(-p + \sqrt{p^2 + p^2})$ . therefore  $P = -p \log(1 + p^2) - \log. p + 1/(12)$ . And if  $p$ , besides being negative, be very great, we may assume  $1/(1 + p) = p$ , and the logarithm may be neglected; because the logarithm is inconsiderable when compared with the number itself. When, therefore,  $p$  is negative and very great,  $P = -p^3$ ; and since the constant quantity  $C$  may also then be neglected, in comparison with  $p$ , we shall have--and  $Ph - Ch \log p$  Whence  $dx = \frac{p}{h} dp$ , and  $Jk = e \text{const.} + \frac{p^4}{4h}$ ; which value  $hp$  does not increase indefinitely. But with respect to  $y$ , since  $dy = -\frac{p}{h} dp$ , if  $h = \text{const.} + \log. p$ ;  $hp$  which value increases indefinitely along with  $p$ . 250. Proposition II. To construct the trajectory of a heavy projected obliquely in the air, when the angle of elevation is very small. The labour of constructing the curve by approximation becomes in this case more simple; for since the curve deviates very little from the axis, the abscissa  $x$  may be put for the arc  $s$ : whence  $eh \, dx = \dots$
