Original publisher: Cleveland, Ohio : Lewis Research Center, 1991 OCLC Number: (OCoLC)61042049 Excerpt: . . . inherent efficiency of the linearized approach, make the present approach an ideal solution method for unsteady aerodynamic flow fields. In addition to presenting the extension of our numerical scheme to lifting air-foils, another purpose of the present dissertation is to present numerical solutions for a wide range of flow conditions and airfoil geometries in order to assess the relative effects of Mach number, airfoil thickness, camber and angle of attack, and upstream disturbance conditions on the airfoil unsteady response (unsteady lift and moment). Our analysis will consider imposed upstream three-dimensional, vortical disturbances around two-dimensional airfoils of infinite span. We will assume that there are no incident acoustic waves or upstream entropy disturbances. Although we will not directly concern ourselves with the acoustic radiation in the present dissertation, the method that we present can also give the far field unsteady pressure from which the acoustic radiation can be calculated. This avoids the use of Lighthills analogy and the tedious calculation which may result from the refraction and scattering of the radiated acoustic waves by the spatially varying flow field. In a future paper, the present approach will be used to calculate the far field acoustic radiation for arbitrary lifting airfoils in subsonic flows. Dusey 32, and Atassi and Dusey 33, have carried out a similar calculation for flat plate airfoils. In Chapter II we present the general aerodynamic theory and formulate the boundary value problem for the linearized treatment of potential mean flows with imposed upstream, periodic vortical disturbances. In Chapter III we provide the details of the general frequency domain numerical scheme which has been developed for lifting...
